

B2P ONE PORTAL & ERP — OPERATIONAL GUIDE

Telecalling Operations & Daily Intelligence

Complete Staff & Management Training Manual with Real-World Scenarios

Standard Operating Procedures (SOP), system architecture, interactive dashboard controls, strict Asia/Kolkata date locking, mandatory remarks validation, duplicate prevention, and multi-channel executive dispatch.

ORGANIZATION

B2P International Management Solutions

TIMEZONE AUTHORITY

Asia/Kolkata (IST — UTC+05:30) Strict Lock

DATABASE SOURCE OF TRUTH

Supabase PostgreSQL + Google Sheets Sync Engine

SYSTEM VERSION

B2P ONE ERP — Telecalling v2.4 (Phase 1 Enhanced)

TARGET AUDIENCE

Telecallers, Operations Supervisors, CRM Team, Directors

PUBLICATION DATE

September 2026 (Live Release)

Table of Contents

1. Executive Overview & Operating Philosophy	Page 2
2. Strict IST Date Locking Standard & Date Shift Elimination	Page 3
3. Daily Telecalling Entry Workflow & Mandatory Remarks	Page 4
4. Duplicate Warning, Call History Search & "Call Again"	Page 5
5. Interactive Operations Dashboard & 10 KPI Tiles	Page 6
6. Quick Filter Chips & Instant Click-to-Filter Architecture	Page 7
7. Unresolved Calls Action Queue & High-Priority Workflows	Page 8
8. Multi-Channel Reporting: Numbered WhatsApp & Email Dispatch	Page 9
9. Contextual CSV Export & Google Sheets Cloud Sync	Page 10
10. Real-World Case Studies & End-to-End Scenarios	Page 11
11. Staff Daily Checklist & Operational Do's and Don'ts	Page 12

Notice to All Telecalling Staff: This manual provides mandatory operating guidelines. Follow these instructions precisely to maintain accurate data integrity, prevent duplicate lead entries, ensure timely follow-ups, and generate reliable executive analytics.

1. Executive Overview & Operating Philosophy

The Telecalling Operations Module in **B2P ONE Portal & ERP** is designed to capture, organize, and monitor high-volume outbound and inbound customer communication. It connects frontline telecallers directly with business intelligence dashboards, executive dispatch channels (WhatsApp and Email), and automated cloud spreadsheets without manual administrative overhead.

Core Business Objectives

- **Instant Accountability:** Every phone interaction is timestamped and recorded under the logged-in staff member's profile.
- **Zero Lost Follow-ups:** Prospects who request a call back or require ongoing nurturing are isolated into an actionable *Unresolved Calls* queue.
- **Strict Temporal Truth:** All activity is anchored to the Indian Standard Time (IST — Asia/Kolkata) calendar day. Daily reports never shift or substitute dates automatically.
- **Frictionless High-Speed Entry:** Telecallers can log 80+ calls per day without repetitive data entry using automatic duplicate detection and the 1-click *Call Again* workflow.
- **One-Click Management Visibility:** Supervisors can view separate counts for *Follow-ups*, *Call Backs*, and *Wrong Numbers*, click any dashboard tile to see matching calls, and send structured, numbered daily executive summaries via WhatsApp or Email in seconds.

System Architecture Overview

1. Frontend Interface (React + Vite)

Lightweight, responsive, mobile-first interface optimized for rapid telecalling logging. Includes instant validation, non-blocking duplicate alerts, and interactive KPI tiles.

2. Database Layer (Supabase PostgreSQL)

Primary transactional source of truth stored in `telecalling_entries` with Row Level Security (RLS), phone normalization indexes, and IST date partitioning.

3. Background Sync Queue

Reliable event queue stored in `telecalling_google_sync_queue`, buffering every insert or update for background sync to Google Sheets without delaying the telecaller.

4. Multi-Channel Dispatch Engine

Sends numbered WhatsApp messages, triggers Google Apps Script HTML emails to configured management addresses, and exports customized CSV files matching filtered views.

2. Strict IST Date Locking Standard & Date Shift Elimination

CRITICAL SYSTEM RULE: The Daily Report will NEVER automatically shift the report date. If a supervisor selects 24 September 2026, the system queries ONLY `entry_date = '2026-09-24'`. It will NEVER substitute yesterday, previous business days, UTC dates, or the last populated date.

Why Date Shifts Were Completely Eliminated

In earlier versions, when a supervisor opened the Daily Report early in the morning before any staff had logged calls, the system automatically shifted backwards to show "yesterday's data" or "the last active day." While well-intentioned, this caused extreme confusion:

- Supervisors mistook yesterday's numbers for today's morning activity.
- Staff thought previously logged calls were missing or wiped out.
- Changing a filter unexpectedly bounced the date picker back to previous dates.

Under the current version, **the date selector is completely locked to the user's explicit choice**. If zero records exist for the selected date, the system displays an honest, transparent confirmation:

No telecalling entries found for 24 September 2026.
No calls were logged on 2026-09-24. The report date remains fixed on your selection.

Removal of Manual Date Field from Daily Entry

To prevent human error, backdating, or date discrepancies between client devices and servers, the visible **Date** field has been completely removed from the Daily Entry form.

FACTOR	LEGACY APPROACH (DEPRECATED)	CURRENT STANDARD (ENFORCED)
Date Selection	Manual calendar picker on entry form.	Completely removed from staff entry screen.
Timezone Calculation	Browser UTC / Local PC time.	Asia/Kolkata (IST — UTC+05:30) calculated at exact save time.
Midnight Rollover	Calls logged after 12:00 AM IST used client timezone.	Automatically increments to the new calendar day at 12:00:00 AM IST.
Database Field	<code>entry_date</code> set by client input string.	Calculated deterministically using <code>getKolkataToday()</code> at save time.

Midnight Rollover Example

Scenario A: Staff member logs a call at 11:58 PM IST on 22 September 2026.

→ System sets `entry_date = '2026-09-22'`.

Scenario B: Staff member logs a call at 12:05 AM IST on 23 September 2026.

→ System sets `entry_date = '2026-09-23'`. Staff does not need to adjust any date.

3. Daily Telecalling Entry Workflow & Mandatory Remarks

The Daily Entry screen (TelecallingDailyEntry.tsx) is the core operational cockpit for frontline staff. It is streamlined for maximum typing speed while enforcing strict data hygiene.

Field-by-Field Entry Standard

FIELD NAME	TYPE	REQUIREMENT	VALIDATION & OPERATING RULES
Company / Client Name	Text	MANDATORY	Full business name or individual name. Triggers real-time duplicate check.
Contact Person	Text	Optional	Key decision maker, manager, or owner spoken with during the call.
Phone Number	Tel	MANDATORY	10-digit primary mobile number. Auto-normalized and checked for duplicates.
Other Phone	Tel	Optional	Landline, extension, or alternate mobile number.
Location / City	Text	Optional	City, industrial area, or state (e.g., "Kochi", "Ernakulam", "Dubai").
Email Address	Email	Optional	Corporate or direct email for quotation or brochure dispatch.
Call Result / Status	Select	MANDATORY	Choose from the 9 standard outcome categories (see Chapter 5).
Feedback / Remarks	Textarea	MANDATORY	Cannot be blank. Detailed notes on conversation and agreed next steps.

Why Feedback / Remarks is Strictly Mandatory

In high-volume operations, telecallers frequently select a status (such as *Follow-up Required* or *Interested*) but leave the remarks field completely blank. This leads to critical business failures:

- Another staff member picking up the lead has no idea what was discussed.
- Supervisors cannot evaluate call quality or customer objections.
- Prospects become frustrated when asked the same introductory questions twice.

System Validation Rule: If a telecaller attempts to save a record with an empty or whitespace-only feedback field, the form blocks submission with an immediate error:
"Please enter feedback or remarks for this call."

Examples of High-Quality vs. Rejected Remarks

- REJECTED (BLANK / USELESS): "Ok", ".", "Call done", ""
- ACCEPTED (HIGH QUALITY): "Spoke with Mr. Suresh (Director). Interested in ISO certification package. Requested proposal by email. Call back on Monday 11:00 AM."
- ACCEPTED (WRONG NUMBER): "Person answered stated this is a residential number and has no connection with Apex Trading. Marked wrong number."

4. Duplicate Warning, Call History Search & "Call Again"

A major challenge in telecalling is multiple callers contacting the same prospect on the same day, or failing to recall what was discussed last week. B2P ONE solves this with **Feature 8 (Search History)** and **Feature 6 (Duplicate Warning)**.

Real-Time Duplicate / Previous Call Warning

As soon as a telecaller types **10 digits of a Phone number** or enters a **Company Name**, the system instantly executes an asynchronous query against the complete telecalling_entries database:

NON-BLOCKING WARNING: If matching records are found, an amber alert banner appears immediately above the form:
 **Previous Call Records Found:** Shows the date of the previous call, the telecaller who made it, the status, and the previous feedback remarks.

Crucial Architectural Decision: This alert is strictly non-blocking. It informs the staff member of previous activity but does **not** prevent them from submitting a new call. Multiple calls to the same prospect are normal in sales follow-ups.

The 1-Click "Call Again" Workflow

Inside both the Previous Call Search results and the Unresolved Calls queue, each record features a blue **"Call Again"** button.

DATA FIELD	BEHAVIOR ON "CALL AGAIN" CLICK	OPERATIONAL REASON
Company Name	COPIED EXACTLY	Eliminates retyping company name and prevents spelling variations.
Contact Person	COPIED EXACTLY	Preserves key decision-maker name.
Phone & Other Phone	COPIED EXACTLY	Preserves verified telephone numbers.
Location & Email	COPIED EXACTLY	Preserves demographic and contact metadata.
Call Result / Status	RESET TO BLANK	Caller must record the outcome of the <i>new</i> call, not the old one.
Feedback / Remarks	RESET TO BLANK	Caller must write fresh notes reflecting the current conversation.
Entry Date	FRESH IST TIMESTAMP	Automatically assigned the current Asia/Kolkata date upon save.

Triple-Layer Anti-Duplicate & Double-Submission Protection

To guarantee that accidental double-clicks or repeated submissions never create redundant rows in the database or Google Sheets, the system enforces three independent defensive layers:

1. Synchronous Click Lock

The moment a caller clicks *Save Entry* or *Save & Log Another*, an in-memory synchronous ref (`isSubmittingRef`) blocks all subsequent clicks before React can even re-render. All submit buttons are immediately disabled, the label changes to *"Saving Call Record..."*, and a loading spinner appears.

2. Pre-Insert Duplicate Check Modal

Before creating a new database record, the system checks whether an entry with the same **Phone number** or **Company Name** was already submitted today (or within the last 10 minutes). If found, an interactive modal prompts the caller with side-by-side comparison:

- **Update Existing Record (Recommended):** Overwrites the existing record's status and remarks without appending a duplicate row to Google Sheets.
- **Save as Separate Call:** Explicitly logs a distinct secondary interaction.
- **Cancel:** Returns to editing.

3. Form Reset & Cache Wipe

After every successful save or update, `resetForm()` executes immediately. All inputs (Company, Contact, Phone, Status, Feedback) are cleared, preventing the browser from retaining old payloads. Refreshing the browser starts with a completely clean form.

4. Backend Idempotency Cooldown

Even in the event of browser network retries or parallel requests, `telecallingService` maintains a 15-second de-duplication cache on `company_id + entry_date + phone + company_name`. Redundant payloads within 15 seconds return the existing entry rather than inserting a duplicate.

5. Interactive Operations Dashboard & 10 KPI Tiles

The Daily Report dashboard features **10 distinct, interactive KPI tiles**. Each tile displays the real-time count for the selected date and functions as an instant 1-click filter for the entire records table.

The 10 Operational KPI Tiles

TOTAL CALLS

TILE 1

Total Logs

Total call volume across all staff. Click to view all records.

UNRESOLVED

TILE 2

Pending Action

Follow-up, Call Back, No Answer, or Switched Off.

APPOINTMENTS

TILE 3

Confirmed

Confirmed face-to-face or video meetings with clients.

INTERESTED

TILE 4

Details Shared

Prospect expressed interest; brochure or quotation sent.

FOLLOW-UP (SEPARATE)

TILE 5

Nurturing

Ongoing discussions requiring scheduled follow-up.

CALL BACK (SEPARATE)

TILE 6

Client Callback

Client was driving/busy and asked to be called back.

NO ANSWER

TILE 7

No Response

Phone rang completely without answer.

SWITCHED OFF

TILE 8

Not Reachable

Network busy, out of coverage area, or switched off.

NO INTEREST

TILE 9

Declined

Prospect explicitly declined services or no need.

WRONG NUMBER

TILE 10

Invalid

Incorrect phone number, disconnected, or wrong entity.

Why Follow-up Required and Call Back are Separated: Mixing these two categories previously caused operational confusion. A *Call Back* means the client was temporarily occupied (e.g. driving, meeting) and needs a call within hours. A *Follow-up* is a strategic sales step after sharing pricing or information. Keeping them distinct ensures proper prioritization.

6. Quick Filter Chips & Instant Click-to-Filter Architecture

Supervisors and telecallers need to switch between call categories instantly without scrolling through long tables or dropdown menus.

Interactive Tile Click Functionality

Every single dashboard card is interactive:

1. **Click any Tile:** Clicking on *Appointments* (Tile 3) immediately filters the table below to show ONLY the confirmed appointment records.
2. **Active Visual Indicators:** The active tile is highlighted with an emphasized colored border, background tint, and an **ACTIVE** status badge.
3. **Toggle Off:** Clicking the active tile a second time clears the filter and restores all records.
4. **Clear Filter Banner:** A prominent top banner displays: "*Filtered by Status: [Selected Status] (X of Y entries)*" with a 1-click **Clear Filter** button.

Global Metric Stability Architecture

A frequent defect in web reporting occurs when applying a filter re-computes the dashboard KPIs based only on the filtered rows—causing all other KPI numbers to suddenly drop to zero.

How B2P ONE Solved This: The data loader (loadReport) fetches the complete daily dataset from Supabase once. The KPI tiles calculate totals across the **entire day's data**. When you click *Wrong Number*, only the displayed rows are filtered in memory. The dashboard cards retain their full numbers (Appointments: 5, Interested: 8, Follow-up: 12), ensuring supervisors never lose overall operational perspective.

Horizontal Quick Filter Chip Bar

Positioned right above the data table, the quick filter bar allows rapid 1-click cycling between:

7. Unresolved Calls Action Queue & High-Priority Workflows

The **Unresolved Calls Queue** (Feature 9 & 10) aggregates every interaction from the selected date that still demands operational follow-through.

Centralized Unresolved Status Definition

In `src/types/index.ts`, unresolved status eligibility is centralized in one strict constant:

```
export const UNRESOLVED_STATUSES: TelecallingStatus[] = [
  'Follow-up Required',
  'Call Back',
  'No Answer / No Response',
  'Not Reachable / Switched Off',
  'Interested / Details Shared'
];
```

The following statuses are strictly **excluded** as they represent terminal or closed outcomes:

- Appointment Confirmed (Converted into field appointment).
- No Interest (Prospect explicitly opted out).
- Wrong / Invalid Number (Dead contact; flagged for database cleanup).

Dedicated Action Buttons for Every Unresolved Lead

Each card in the Unresolved Calls view provides 4 rapid-fire actions:

ACTION BUTTON	ICON	FUNCTION & BEHAVIOR
Call	 Phone	Triggers native device dialer (tel:+91XXXXXXXXXX) on mobile or VOIP software on PC.
WhatsApp	 Message	Opens WhatsApp Web or mobile app directly to the client's normalized phone number.
Copy Phone	 Copy	Copies 10-digit number to clipboard with instant visual confirmation ("Copied!").
Call Again	 Refresh	Opens Daily Entry pre-filled with company, contact, and phone for a fresh IST log.

8. Multi-Channel Reporting: Numbered WhatsApp & Email Dispatch

Management requires daily visibility without logging into the ERP. The system provides two instant executive dispatch channels: **Numbered WhatsApp Summaries** and **Comprehensive HTML Email Reports**.

1. Formatted Numbered WhatsApp Dispatch

When the user clicks the green **WhatsApp** button on the Daily Report, the system builds an executive text payload. Every single result status is listed on a separate, numbered line with its explicit count:

B2P INTERNATIONAL — DAILY TELECALLING REPORT

 *Date:* 24 September 2026

SUMMARY:

- Total Calls: 68
- Unique Companies: 59
- Action / Unresolved Pending: 31

CALL OUTCOMES:

1. Appointment Confirmed: 6
2. Interested / Details Shared: 14
3. Follow-up Required: 11
4. Call Back: 7
5. No Answer / No Response: 15
6. Not Reachable / Switched Off: 8
7. No Interest: 5
8. Wrong / Invalid Number: 2
9. Other: 0

TELECALLER PERFORMANCE:

- Anju: 38 calls
- Priya: 30 calls

UNRESOLVED ACTION QUEUE (TOP ITEMS):

1. Skyline Logistics (Suresh - 9847123456)
Status: Follow-up Required | Caller: Anju
Remarks: Send quotation for ISO audit.
2. Horizon Enterprises (Rahul - 9447654321)
Status: Call Back | Caller: Priya
Remarks: Client in meeting. Call at 4 PM.

Generated automatically via B2P ONE Portal & ERP

2. Executive Email Dispatch (Google Apps Script Integration)

Clicking **Send Mail** triggers an asynchronous HTTP POST request to the Google Apps Script Web App:

- **Configurable Recipient:** Reads from dedicated key `b2p_owner_report_email` (or company profile). Never hardcoded to a personal developer email.
- **Executive HTML Table:** Renders a styled, responsive HTML table containing full daily KPI counts, telecaller productivity metrics, and the unresolved action list.

- **Zero-Failure Fallback:** If the cloud script is unreachable or returns a network error, the system automatically displays an "Open in Email App (mailto:)" fallback button pre-populated with subject and body.

9. Contextual CSV Export & Google Sheets Cloud Sync

Data portability and external auditing are supported through **Feature 11 (Contextual CSV Export)** and continuous **Google Sheets Cloud Sync**.

Feature 11: Contextual / Filter-Aware CSV Export

A frequent complaint with standard ERP systems is that clicking "Export" downloads the entire multi-year database rather than what the user is currently examining.

Contextual Export Rule: The CSV Export button generates a file containing **ONLY the currently filtered records**. If a supervisor has filtered by *Call Back* and telecaller "Anju", the CSV will contain only those specific calls.

Automatic Filename Naming Convention

- **Unfiltered Daily Export:** Telecalling_Report_2026-09-24.csv
- **Filtered View Export:** Telecalling_Report_2026-09-24_Filtered.csv

Data Hygiene & RFC-4180 Escaping

The CSV generator strictly implements:

- **UTF-8 Byte Order Mark (BOM):** Ensures Microsoft Excel opens Indian names and symbols without character corruption.
- **Field Quoting & Escape:** Quotes all fields containing commas, line breaks, or double quotes (escaped as "").
- **Excluded Technical IDs:** Internal database UUIDs and raw sync payloads are omitted for executive clarity.

Google Sheets Background Cloud Sync Architecture

Every call logged in B2P ONE is automatically queued for cloud synchronization:

1. Upon save, the record is inserted into `telecalling_entries` and simultaneously written to `telecalling_google_sync_queue` with status pending.
2. A background synchronization service dispatches the queue payload to the Google Apps Script Web App.
3. The Google Apps Script appends the row to the organization's master Google Sheet.
4. If the telecaller's internet connection drops, the queue holds the record offline and retries automatically once connectivity is restored—guaranteeing **zero lost records**.

10. Real-World Case Studies & End-to-End Scenarios

Scenario A: First Contact with a New Prospect

Workflow: Logging a Fresh Call

- 1. Search Check:** Telecaller Anju receives a list of prospects. She enters phone 9847112233 in the search bar. The system shows: *"No previous calls found."*
- 2. Information Entry:** Anju inputs Company: Apex Marine Supplies, Contact Person: Capt. Varma, Location: Cochin Port.
- 3. Conversation:** Capt. Varma states he needs calibration services next month and asks for a company profile via WhatsApp.
- 4. Logging Outcome:** Anju selects Status: **Interested / Details Shared**.
- 5. Remarks Validation:** She writes: *"Capt. Varma requested company profile. Interested in calibration services for October drydock. Profile sent via WhatsApp."*
- 6. Save:** Anju clicks **Save Telecalling Entry**. The entry is permanently recorded under 2026-09-24 (IST).

Scenario B: Handling a Callback with "Call Again"

Workflow: Managing Callbacks without Retyping

- 1. Initial Call:** At 10:30 AM, Priya calls Delta Logistics (Phone: 9447889900). Contact Mr. Roy says: *"I'm driving right now, call me back sharp at 3:30 PM."*
- 2. Initial Log:** Priya logs Status: **Call Back**, Remarks: *"Driving. Requested call back at 3:30 PM today."*
- 3. Afternoon Follow-up:** At 3:30 PM, Priya opens the **Unresolved Calls** dashboard. Delta Logistics is at the top of the queue.
- 4. Rapid Dial:** Priya clicks the **Call Again** button on the Delta Logistics card.
- 5. Auto-Population:** The entry form opens instantly with Company, Contact Person, and Phone already filled in. Date and Status are blank.
- 6. Conclusion:** Priya speaks with Mr. Roy and schedules a video demo. She selects Status: **Appointment Confirmed**, Remarks: *"Confirmed demo on Friday 11 AM via Google Meet."*

Scenario C: Supervisor Evening Review & Dispatch

Workflow: End-of-Day Management Reporting

- 1. Open Daily Report:** Supervisor opens Daily Report at 5:30 PM. The date is locked to 2026-09-24.
- 2. Review KPIs:** Supervisor reviews the 10 tiles: Total Calls = 74, Appointments = 5, Call Back = 6, Wrong Number = 3.
- 3. Tile Inspection:** Supervisor clicks the **Wrong Number** tile. The table immediately filters to 3 records. Supervisor verifies staff remarks and removes those bad numbers from the marketing sheet.
- 4. Export Audit CSV:** Supervisor clicks **CSV Export**. The file `Telecalling_Report_2026-09-24_Filtered.csv` is downloaded with the 3 wrong numbers for data cleansing.
- 5. Dispatch to Owner:** Supervisor clicks **Reset**, then clicks **WhatsApp**. The system opens WhatsApp with the structured numbered breakdown (1 to 9) and top unresolved leads. Supervisor clicks Send.

11. Staff Daily Checklist & Operational Do's and Don'ts

DO'S (Mandatory Practices)

- **Always search phone first:** Check if a colleague called the prospect earlier today to avoid duplicate calling.
- **Write meaningful feedback:** Always note the contact's job title, objections, specific requirements, and promised next steps.
- **Use "Call Again" for callbacks:** Save time and preserve data integrity by using the 1-click button instead of typing from scratch.
- **Clear unresolved items daily:** Review your Unresolved queue before leaving for the day.
- **Mark Wrong Numbers accurately:** Flag invalid or disconnected numbers so the database remains clean.

DON'TS (Strictly Prohibited)

- **Do NOT enter placeholder remarks:** Entering dots, "ok", or single words is a violation of operational standards.
- **Do NOT mark Appointments without agreement:** Only use *Appointment Confirmed* when the client agreed to an exact date/time.
- **Do NOT ignore duplicate warnings:** When an amber alert appears, read the previous feedback before proceeding.
- **Do NOT use browser UTC extensions:** Do not tamper with PC clock or timezone settings; the server enforces IST.
- **Do NOT share reports outside authorized channels:** Telecalling data contains confidential customer contact details.

Staff Daily Operational Checklist

TIME WINDOW	OPERATIONAL TASK	VERIFICATION MECHANISM
09:00 AM — 09:30 AM	Open Unresolved Queue. Review yesterday's pending Call Backs and Follow-ups.	Check Tile 2 (Unresolved Calls) on Daily Report.
09:30 AM — 01:00 PM	Primary calling session. Log every call immediately after hanging up.	Ensure Feedback / Remarks is completed for every log.
02:00 PM — 04:30 PM	Afternoon calling session & scheduled callbacks from morning conversations.	Use <i>Call Again</i> action to log callback outcomes.
04:30 PM — 05:00 PM	Review personal daily numbers and resolve any remaining callbacks.	Filter by your name in Daily Report dropdown.
05:00 PM — 05:30 PM	Supervisor review: Dispatch numbered WhatsApp summary and HTML email to management.	WhatsApp message sent; CSV archived if required.
